

TAKE-HOME ASSIGNMENT

Shipment Status Tracker

Build a small full-stack application that tracks shipments as they move through different status stages.

Time Box

You have **2 days** from receipt to submit. This should take roughly **6–8 focused hours** — we're not expecting production polish, and we'd rather see clean, well-reasoned code in less time than a rushed feature-complete app.

Tech Requirements

- **Language:** JavaScript or TypeScript (*TypeScript preferred*), frontend and backend.
- **Frontend:** any framework of your choice (*React / Next.js recommended*).
- **Backend:** any Node.js framework (*Express, Fastify, NestJS, etc.*).
- **Database:** your choice, as long as data persists between restarts (*Postgres preferred — reflects our stack*). If you'd rather not install Postgres locally, a **docker - compose** file spinning up just a Postgres container is a good lightweight option — entirely up to you.

Functional Requirements

1. Create a shipment: reference number, origin, destination, current status, expected delivery date. Add more fields if useful.
2. List shipments with their current status.
3. Update a shipment's status. Define your own status stages (*e.g. Booked, In Transit, Customs Hold, Delivered*).
4. View a single shipment's **history** — the sequence of status changes over time, not just the current state.
5. Search or filter the shipment list by status or reference number.

Data model, API design, and frontend behavior are up to you.

Running It

No Docker requirement. A Dockerfile is a nice-to-have. Include clear steps in your README to run the project locally (*e.g. `npm install && npm run dev`*).

Deployment

Deploy your frontend and backend **on separate platforms** (*e.g. frontend on Vercel, backend on Railway / Render / Fly.io / etc.*). This is **required**, not optional.

Submission

1. **GitHub repository link** — commit incrementally as you build, not one final commit.
2. **Live deployment link(s).**
3. **README** covering:
 - Tech choices you made and why.
 - Steps to run the project locally.
 - Any assumptions you made about the data model or status flow.
 - One paragraph: "If this needed to support 10,000 shipments and multiple concurrent users, what would you change?" (No need to build it — we just want to see how you think about it.)

Out of scope — don't spend time here: authentication, multi-user support, roles/permissions.

Strong candidates may be asked to complete a short follow-up technical exercise as part of the interview process.
